

Factions World Guide

A practical rollout plan for running a factions-style world on your RealmTool server using the systems already present in the plugin, with a clean path to upgrade into true factions later.

REALMTOOL BASED

CLAIMS READY

ECONOMY INTEGRATED

WORLD ROLLOUT PLAN

1. Executive Summary

Your plugin is already capable of supporting a factions-themed world, but it is not yet a full factions system.

Best immediate approach: launch a factions world using the existing chunk-claim, trust, economy, rank, quest, and PvP systems first. Do not build diplomacy, faction power, or faction-owned land until you confirm that the player base actually wants deeper territorial warfare.

The current codebase already supports:

- Chunk claims with hard build protection.
- Trusted-player access inside claims.
- A claim proximity buffer to prevent adjacent hostile claims.
- Playtime-based claim expansion.
- Economy, bounties, kits, quests, duels, achievements, reports, and ranks.
- World creation and world utility menus for admin control.

The missing parts for a true factions system are faction identity, membership, leadership, diplomacy, shared ownership, faction balance, faction power, and raid-state logic.

2. What RealmTool Already Gives You

Claims and Protection

- Players can claim and unclaim chunks from the claims GUI.
- Players can trust and untrust others for access.
- Claimed areas block placing, breaking, containers, door use, beds, fluid grief, and most interaction grief.
- Admins can bypass claims using admin permissions or `claims.override`.

Progression and Economy

- Coins and XP systems already exist.
- Mining, monster kills, login rewards, shops, bounties, kits, and quests can all support world progression.
- The economy can be used to gate expansion, travel, gear, and events.

Ranks and Identity

- Ranks already support prefixes and permissions.
- You can use ranks as temporary faction tags while the world is in phase 1.
- Staff and faction-lead style permissions can be modeled with ranks before building real factions.

World Management

- The plugin can create worlds and expose world utilities through admin menus.
- You can isolate the factions world from hub, staff, event, or survival worlds.
- This allows separate rules without rewriting the whole server.

3. Recommended Rollout Strategy

Phase 1: Factions-Themed World Using Existing Systems

This phase is the fastest, lowest-risk path. It delivers the gameplay loop most players actually notice: group identity, land ownership, base defense, economy pressure, and PvP rivalry.

1. Create a dedicated world for factions gameplay.
2. Keep hub, admin, and utility worlds separate from the factions world.
3. Require each group to appoint one leader who owns the claims.
4. Use trust lists to grant access to that group.
5. Use ranks or nickname formatting for faction tags.
6. Use quests, bounties, shops, and kits to shape progression.
7. Do not allow true raiding until your rules are stable and tested.

Phase 2: Build True Factions Only If Needed

After the world proves fun and active, add actual faction entities and faction-owned claims. This is where the larger code changes become worth the effort.

4. World Setup Plan

Area	Recommendation	Reason
Main Hub	Keep separate from the factions world.	Prevents grief, reduces confusion, and gives you a controlled onboarding point.
Factions World	Use as the primary group-survival and PvP territory world.	All claims, rivalries, resource competition, and group identity live here.
Spawn Zone	Make it safe, non-buildable, and clearly marked.	Reduces spawn camping and creates a stable launch area.
War Zone	Optionally set an unclaimed region near center map.	Encourages PvP without forcing raids on claimed bases.
Resource Flow	Let ores, mob grinding, and shops feed the economy.	Maintains reasons to travel, trade, and contest territory.

5. Recommended Rules for Phase 1

Core Rules

- One leader owns group claims. Members are added through the trust system.
- No base griefing inside claimed chunks by outsiders.
- PvP is allowed in the factions world except safe zones you define.
- Spawn area, admin areas, and event zones remain protected and non-raideable.
- Map out exactly where players may and may not build before launch.

Claim Rules

- Claims scale with playtime automatically. The current formula is generous enough to support growth.
- The current 2-chunk buffer between hostile claims should stay enabled at launch.
- Do not remove the buffer until you are certain you want dense border conflict.

Raid Rules

For launch, the safest rule is simple:

Recommended launch rule: PvP is active, but claimed bases are not raidable by outsiders. Conflict happens through open-world fights, bounty pressure, supply disruption, and control of unclaimed land.

This gives you a factions atmosphere without the operational pain of raid disputes and rollback requests.

6. Progression Design

Early Game

- Players establish a base and claim starter land.
- Basic kits, mining, and mob combat build initial resources.
- Small bounty conflicts and border skirmishes create momentum.

Mid Game

- Groups expand claims as playtime increases.
- Quests and shops become more important for gearing and income.
- Faction identity grows around tags, alliances made socially, and recurring rivals.

Late Game

- High-end kits, custom enchantments, bounties, and economy pressure drive competition.
- Admin events or war-zone drops can create scheduled conflict without base grief.
- If demand is strong, this is the point to consider true factions development.

7. How to Use Existing RealmTool Features in the World

Feature	How It Fits a Factions World
Chunk Claims	Acts as land control and base security.
Trust System	Acts as temporary faction membership access.
Ranks	Acts as faction tag, internal roles, or prestige identity.
Bounties	Encourages inter-group hostility and revenge loops.
Quests	Provides structured progression and goals.
Kits and Crates	Supports gearing and milestone rewards.
Player Shops	Creates supply lines and group economies.
Duels and PvP Stats	Supports rivalry, skill expression, and bragging rights.
World Utilities	Lets staff manage and moderate the world more cleanly.

8. What True Factions Would Require Later

If you decide to evolve beyond the current owner-plus-trust model, these are the actual systems to build.

New Data Model

- Faction id and faction name.
- Leader, officers, members, invites, banned members.
- Faction home and faction metadata.
- Faction bank or balance.
- Allies, enemies, truces, or neutral standings.

Claim Ownership Changes

- Claims must be owned by factions rather than player UUIDs.
- Protection checks must grant access based on faction membership or role.
- Claim UIs must show faction ownership rather than player ownership.

Optional Advanced Systems

- Faction power or upkeep costs.
- Scheduled raid windows.
- Faction homes and faction chat.
- Faction logs and territory history.
- Web panel support for factions if you want admin visibility outside the game.

9. Launch Checklist

1. Create the factions world.
2. Set the hub and spawn routing so players enter cleanly.
3. Define safe zones, event zones, and any war zone before launch.
4. Publish claim rules, PvP rules, and staff enforcement rules.
5. Decide whether bounties, kits, and custom enchants are enabled from day one.
6. Test claims, trust, fluid grief prevention, containers, doors, beds, and piston behavior.
7. Confirm staff have claim bypass and moderation access.
8. Run a short test season or beta before calling it permanent.

10. Final Recommendation

Launch a factions world now using the current RealmTool systems. That gives you group territory, progression, economy tension, and PvP immediately with very little engineering risk.

Recommended decision: phase 1 first, true factions second. Build the larger faction ownership model only after the world proves active enough to justify it.

This approach is cleaner, faster, easier to moderate, and much less likely to create months of avoidable code complexity before you know what your players actually want.
